edz@phxequip.com

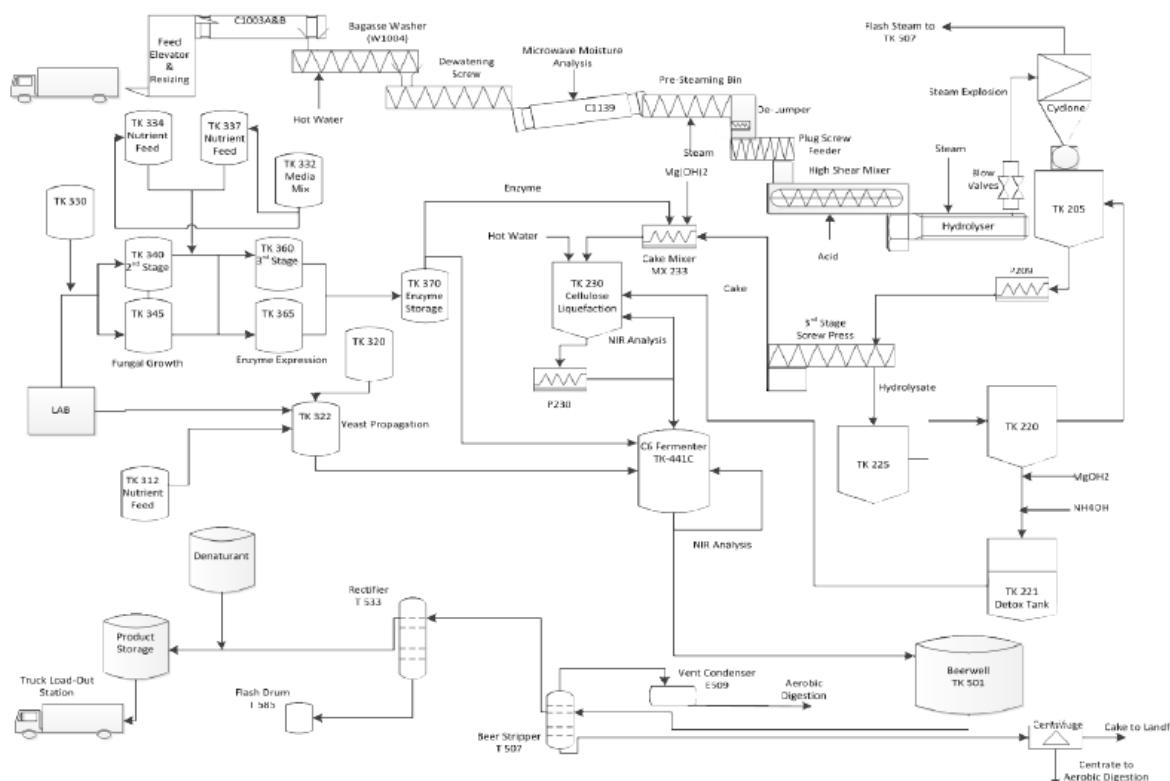

1. Executive Summary

This fermentation facility, located in Jennings, Louisiana, consists of a pilot plant and a demonstration plant, and is for sale with the real estate (approximately 110 acres). The plants were originally designed to produce lignocellulosic ethanol (LCE). The demonstration plant was successfully started in 2009 with production capacity of 1.4 million gallons per year. The demonstration plant conducted 76 batch operation campaigns until 2015. The demonstration plant operated on feedstocks including: (1) common sugar cane, (2) purpose grown energy cane, (3) sorghum, and most recently, (4) bagasse. The pilot plant was used to develop LCE technology.

2. Plant Configuration

The demonstration plant includes the following process sections:

- Feedstock handling
- Feedstock transfer
- Feedstock preparation
- Hydrolysis
- Liquefaction
- Yeast and enzyme propagation
- C5, C6 co-fermentation
- Ethanol recovery

Initially the demonstration plant was purposely configured with the following capabilities:

- outdoor, open air, piled feedstock storage,
- pile-to-plant feedstock movement via front end loader,
- surface contact ambient water wash to remove grit,
- dewatering via screw press prior to acid hydrolysis,
- dilute acid hydrolysis (horizontal digestion) with single stream steam explosion,
- 3-stage, water wash screw press liquid/solid separation of hemicellulose and cellulose,
- hemicellulose sugar (C5) base-addition detoxification,
- fungal growth and enzyme expression production,
- C5 sugar fermentation with bacteria,
- sequential saccharification fermentation of cellulose (C6 sugars) with bacteria,
- carbon steel, conical bottom fermenters with limited heat transfer/mixing capability (sugar cane ethanol),
- 140 DegF caustic CIP capability of fermenters,
- ethanol/water/solids separation via distillation w/ mole sieve dehydration,
- solids separation from wastewater via horizontal decanting with solids disposal via landfill,
- utilities (gas fired steam generation, instrument air, sparge air, cooling tower, chilled water),
- direct contact, water absorption air emissions control,
- ethanol storage, denaturing, and truck loading,
- UF/RO wastewater treatment,
- integrated Rockwell PLC based control hardware,
- and analytical, wet chemistry and biology laboratories.

With continual development of the fermenting organism platform came integrated simplification of the process for a low capex and optimum opex design. Coupled with improvement of fundamental engineering and reliability issues of the original plant construct, the demonstration plant was the recipient of significant investment in capex, namely:

- polyethylene agricultural bag storage of feedstock (store 1-2 yrs. with negligible degradation),
- feedstock classification and foreign object removal via horizontal trammel sifter,
- rare earth magnet removal of ferrous metal,
- hot water wash to remove surface organic acids and residual sugars,
- on-line microwave moisture analysis,
- plug screw feeding of biomass to acid hydrolysis digester,
- dual redundancy of steam explosion,
- in-line dilute acid mixing for acid hydrolysis,
- single fermenting yeast platform for both C5 and C6 sugars,
- stainless steel, ASME elliptical dished head fermenters
- fit-for-purpose fermentation mixing and heat transfer capability,
- 180 °F CIP and 220 °F SIP capability for fermentation,
- multi-stage yeast propagation,

- cellulose liquefaction prior to fermentation,
- on-line NIR (mid-infrared refractometry) for fermentation ethanol and residual sugars,
- mass spectrometry vapor space analysis of fermenters, propagators and enzyme production,
- refit-for-purpose steam generation and upgraded air capabilities,
- natural gas fired thermal oxidizer for fermenting vessel emissions,
- refit for purpose water scrubber for non-fermenting vessel emissions,
- aerated, activated sludge wastewater treatment,
- wastewater holding tankage,
- integrated lab information management system (LIMS),
- and state based, batch managed process control logic.

3. Highlights of Major Equipment

- 55,000 Gallon SS Fermenter, 18' dia x 25'
- (3) 54,000 Gallon CS Fermenter, 19' dia, cone bottom
- 18,200 Gallon SS Fermenter, 10 psi, 12' dia x 19'
- (3) 18,200 Gallon CS Fermenter, 13' dia, cone bottom
- (4) 6,594 Gallon 316L SS Fermenters, 30 psi, with control skid
- Hydrolyzer - 1" thick SS with inco lining
- Alfa Laval Centrisys
- (2) FKC Screw Presses
- Rectifier
- Beer Stripper
- Thermal Oxidizer
- FKC Dewatering Press
- Texas Power Screen, manufactured by Phoenix (A Terex company), mobile
- TK-205 (Replacement) - Blow down tank for hydrolyzer, Approx 20,000 gal 316L SS Pressure Vessel, designed for 150 psi, 10' dia x 24'
- Unused DAF System

4. Equipment List

| ID # | Equipment |
|--------|--|
| TK-207 | HYDROLYZER EXPANSION TANK |
| MX-271 | HYDROLYZER RETENTION SCREW |
| TK-205 | 1st STAGE SCREW PRESS FEED TANK |
| TK-206 | BLOW CYCLONE AND FLASH VESSEL |
| TK-222 | 2ND STAGE SCREW PRESS. TK. |
| TK-220 | 1ST STAGE PRESS. FILTRATE TK. |
| TK-224 | 3RD STG SCREW PRESS TK. |
| TK-223 | 2ND STG PRESS FILTRATE TK. |
| TK-225 | 3RD STG. PRESS FILTRATE TK |
